Retrofit Kit for use with most jackhammers:

Kit includes instructions and everything needed to adapt the twinline jackhammer hose to an existing hammer.

Effective September 2017, OSHA regulation 29 CFR 1926.1153 requires employers to limit worker exposure to RCS (Respirable Crystalline Silica). RCS is a mineral typically found in concrete, brick, mortar, sand and stone which has been linked to potentially debilitating respiratory diseases if embedded into the worker's lungs. Water is one of the preferred methods of dust control which helps to mitigate potential for exposure to RCS on job sites.

LP35 is a lightweight liquefied petroleum gas (LPG)/propane delivery and transfer hose. The hose meets all Underwriters Laboratories (UL21) and Canadian (CSA 8.1 Type I) requirements. The construction incorporates multiple textile plies of reinforcement for flexibility and kink resistance. The perforated cover is resistant to mild chemicals, oil and ozone. LP35 is available in long lengths on reels, long cut lengths and factory-tested assemblies from stock in popular configurations.

LP35 and Natural Gas: The molecules of natural gas are small, enhancing their ability to permeate through standard rubber hose constructions. The permeation process is more rapid as the working pressure increases, and natural gas accumulates with potentially dangerous consequences. LP35 may be used for natural gas service, but ONLY under ALL of the following conditions:

- The application must be in a well-ventilated environment: Outdoors, or indoors with significant continuous air movement.
- LP35 is not to replace fixed/rigid pipe where that material is more appropriate due to reduced permeation and overall strength and durability. Use rigid pipe, non-permeable tubing or hose with barrier constructions to convey natural gas whenever possible.

LP35 and Compressed Natural Gas (CNG): Do not use LP35 for CNG engine applications in on-road vehicles, or for high-pressure CNG dispenser/transfer applications (typically 2,900 PSI or greater). In other applications-- where CNG is regulated to pressures within the rating of LP35--apply the guidelines for natural gas applications stated above. Always review and adhere to all applicable government and industry regulations and standards prior to installing this hose in a CNG or natural gas application.

ST10 CHLOROBUTYL

Application:

ST10 is a compact, slim profile hose designed for long-lasting steam service—one of the toughest applications for hose, where the hot-cold/wet-dry cycling attacks rubber compounds externally as well as internally. The hose construction incorporates premium, high-performance chlorobutyl in both the tube and the cover, providing extreme heat resistance, durability, performance, and service life. The wire braid reinforcement provides crush-resistant durability, kink resistance and a path to conduct a static electrical charge to ground, and the cover resists abrasion, cracking, hardening and ozone. ST10 is qualified with crimp couplings for maintenance-free service. The traditional bolt style clamps and ground joint fittings can also be used with this hose.

Construction:

Tube - Black chlorobutyl

Reinforcement - Multiple wire braid

Cover - Black or Red EPDM, perforated wrapped finish

Safety Ratio - ¾" & 1" are 20 to 1 and 2" are 10 to 1

Temperature Range:

-18°C to +208°C (0°F to +406°F) Saturated/Superheated Steam

ST11 CHLOROBUTYL

Application:

ST11 series steam hose is a distinctive hose designed for long-lasting steam service—one of the toughest applications for hose, where the hot-cold/wet-dry cycling attacks rubber compounds externally as well as internally. The hose construction incorporates a premium, high-performance chlorobutyl tube which resists heat and popcorning, and a wire braid reinforcement for crush-resistant durability, kink resistance and a path to conduct a static electrical charge to ground. The EPDM cover resists abrasion, cracking, hardening, and ozone. The red/black barber pole cover provides color-coded identification from all angles and great distances. ST11 series steam hose is qualified with crimp couplings for easy and quick assembly fabrication as well as maintenance-free service. The traditional bolt style clamps and ground joint couplings can also be used on this hose.

Construction:

Tube - Black chlorobutyl

Reinforcement - Multiple wire braid

Cover - Red and Black striped EPDM; perforated wrapped finish

Safety Ratio - 1/2", 3/4" & 1" are 20 to 1

Safety Alert

* The bolts used in the interlocking clamps are not standard bolts. They vary from standard bolts in their length, diameter, overall thread length and material hardness. These bolts can be retorqued, but it is not recommended that the bolts or clamps are reused, as they are designed for a single bend only. We recommend using only factory supplied replacement bolts.

* Torque values for clamps are based on dry bolts. The use of lubricant on bolts will adversely effect clamp performance. Do not lubricate nuts and bolts.

WHIP CHECKS

Hoses can whip if they become accidentally uncoupled or tear away from the fitting. Whipchecks act to control whipping in the event of a failure. Spring-loaded loops in the cable ends open easily to pass over the couplings, for a firm grip on the hose.

To function properly, restraint cables must be installed in a fully extended position with no slack. Maximum working pressure is 200 PSI.

IN LINE LUBRICATORS

Air entering the inlet pressurizes both the lower and upper chamber. When the tool reciprocates, there is a sudden pressure drop in the lower chamber. When this occurs, the oil is forced through the valve into the air stream. The amount of oil injected is adjusted by opening or closing the metering valve. Pooling of oil in the line after use can be reduced by turning the unit upside down after shutdown. This allows the pressure in the two chambers to equalize thus eliminating the pressure differential causing the oil flow. Installation is recommended within 25 feet of the tool to be lubricated. Minimum flow rate is 30 SCFM.

In-line lubricator has a fill plug and sight disc.

8" CAMLOCKS STYLE 1 & 2 IDENTIFICATION

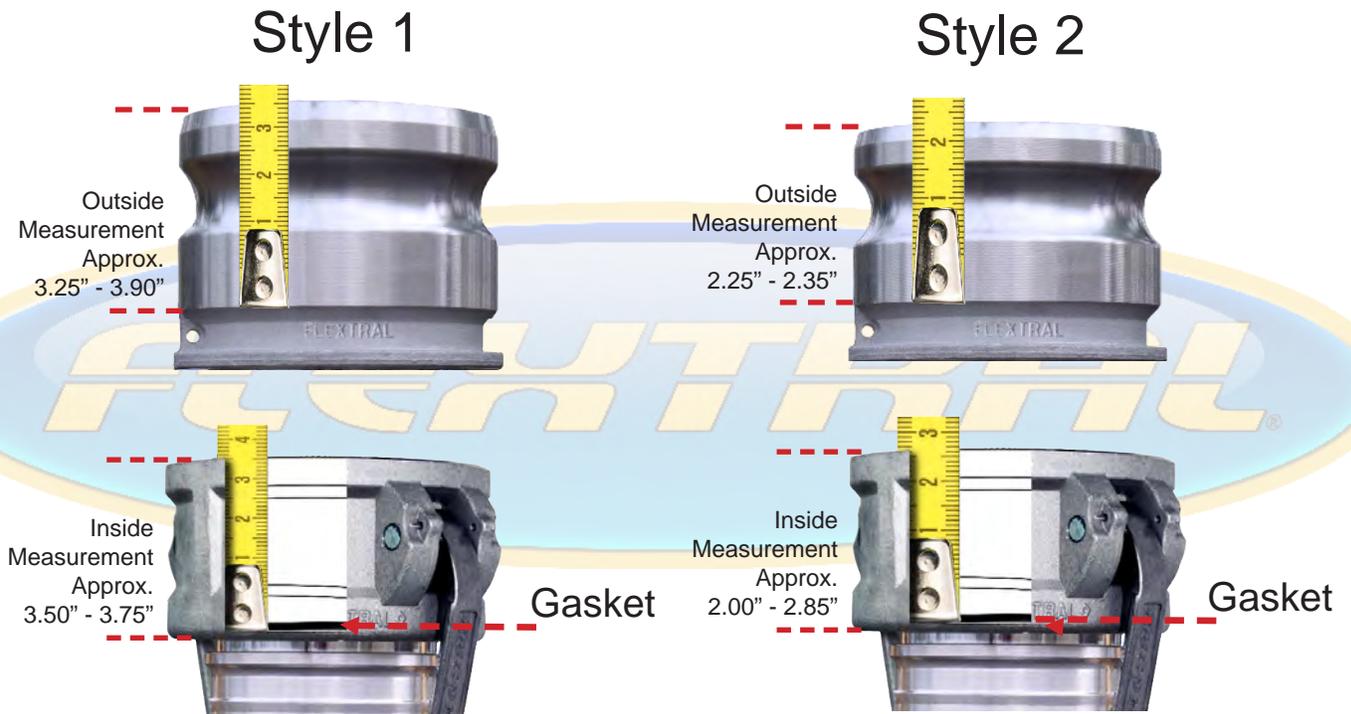

All camlock couplers and grooved mating ends in sizes ¾" - 6" are manufactured in accordance to Mil-A-A59326D. There is no Mil standard for 8" Camlock couplings, hence there are two styles in today's market and the two do not interchange.

The original Style #1 is the Ever-Tite standard. The Style #2 is manufactured to the P-T standard. The Style #1 is notably larger and will not interchange with the #2 style. The suppliers for both Styles can be seen below.

Original Style/#1
 Ever-Tite
 Dixon Andrews
 NECO
 Kuri HD801
 PT Import – Style #1
 UPD
 Sealfast

Style #2
 PT Domestic
 PT Import – Style #2
 KOA (Import) AL-x800
 Dixon Boss Lock
 Dixon Global
 Jason
 Campbell Cobra

The quickest way to check the style of your existing couplings is to measure the machined diameter of the adapter. If the adapter is larger than 9" O.D, then you have the Original Style #1. If the diameter is less than 9" O.D., then you have the Style #2.

CRIMP BAUER STYLE COUPLINGS

Flextral Crimp-X Bauer style couplings will interchange 100% with all Bauer style quick couplings and are more competitively priced than Uber Bauer style and the HD Bauer style. One of its biggest advantages is in the proprietary shank design, where we can achieve test pressures on all hose styles from thin lay-flat hoses to hard wall suction/discharge hoses. Bridgestone HosePower can supply a fully-tested and certified hose assembly, which the industry requires.

PE32-34 CRIMP-FUEL COUPLINGS

These couplings are designed for use with fuel dispensing hoses. (See PE32-PE34) A heavy duty crimp style coupling used on this fueling island, also known as "curb pump" in the dispensing of various petroleum based fuels. The 5/8", 3/4", & 1" inserts are chrome plated. The ferrules are made of aluminum.

GAS PUMP FITTINGS

Machined from brass and then chrome plated. Reusable couplings can be installed with wrenches. All gas pump fittings should be grounded to the wire reinforcement of the hose using a staple or pin during assembly. Correct matching of the hose outside diameter to the coupling is necessary to ensure good coupling retention.

INTERNAL EXPANSION COUPLINGS - SCOVILL STYLE

Internal expansion couplings are manufactured from solid brass forgings. Ferrules are cold-drawn copper alloy. These couplings can only be installed using a Scovill type internal expansion machine.

***Measuring outside diameter of each hose end is critical to proper ferrule selection. Each hose end and ferrule must be measured and verified.**

WAVE CLAMP

The Ideal Wave clamps utilize a patented wave ring technology that self-adjusts automatically as thermal cycling occurs. It expands and contracts as the sealed joint changes, maintaining a constant, steady pressure 360 degrees around the connection. This produces a sealing o-ring effect that prevents leakage.

HOSE HANDLE CLAMPS

These handles are a ground breaking tool composed of Long Glass Nylon which enhances the thermal properties compared to commonly used materials, such as aluminum. In addition, this lightweight material is stronger and more wear-resistant. From temperatures of -40°C to +50°C (-40°F to +122°F), each handle is designed to battle the most aggressive environments.

This easy-to-use mechanism enables you to clamp onto hoses or pipes effortlessly without damaging the hose or dirtying your hands. The hose handle allows for easier movement in the field and increased efficiency with the capability to move two hoses at a time. Effective in all types of environments, the handle allows you to grip, torque, and release single-handedly through a natural fluid movement.

CHEMICAL GUIDES INTRODUCTION

The Chemical Guides in this section are offered as a general indication of the compatibility of the various compounds incorporated in Flextral hose with the chemicals, fluids and media listed. The basis for the ratings includes actual service experience, the advice of various polymer suppliers, and the considered opinion of our chemists. When in doubt, a sample of the compound should always be tested with the particular chemical it is to handle.

Some of the variables that affect the resistance of a compound to a chemical attack are:

- 1. Temperature of the Media Transmitted:** Higher temperatures increase the affect of chemicals on compounds. The amount of increase depends upon the polymer and the chemical. A compound quite suitable at room temperature might fail very quickly at higher temperatures. Working pressures in this catalog are recommended in accordance with ARPM design safety factors at ambient temperatures. Do not operate outside hose temperature limits. Even within hose temperature limits, end fittings and hose size can affect performance at higher temperatures.
- 2. Service Conditions:** A rubber compound usually swells when exposed to a chemical. Within a given percent of swell, a hose tube may function satisfactorily if the hose is in a static condition, but may fail quickly if the hose is subject to flexing.
- 3. The Grade or Blend of the Rubber Compound:** Basic polymers are sometimes mixed or blended to enhance a particular property for a specific service. As an example, the nitrile used as the tube material for Flextral PE08 Petro-Flex tank truck hose varies in its makeup from the nitrile used in the tube of PE52 Dock-Flex tanker transfer hose. Consequently, the reaction to a particular chemical may therefore be somewhat different. When in doubt, a sample of the compound should always be tested with the particular chemical it is going to handle.

HOSE & CHEMICAL TABLE

Refer to the guides on the following pages for specific applications.

WARNING! The following data is based on tests and believed to be reliable; however, the tabulation should be used as a guide ONLY, since it does not take into consideration all variables, such as elevated temperatures, fluid contamination, concentration, etc., that may be encountered in actual use. All critical applications should be tested. Refer to the Safety & Technical Information section of this catalog for safety, handling and use.

***Refer to the PVC Temperature/Pressure chart on page 269.

Thermoplastic hose and tubing achieve their optimum physical properties at room temperature, +68°F (+20°C). As thermoplastic materials are exposed to increased ambient temperatures, they soften and their physical properties change. For hose and tubing, heat sharply reduces the available working pressure and coupling retention. In all cases, test the product in a controlled, secure and safe environment, and consider all operating conditions prior to use.

NOTES:

- Data for PVC/thermoplastic materials based on +68°F unless otherwise noted.
- Data for other materials based on +70°F unless otherwise noted.

Effects of Elevated Temperatures on PVC / Thermoplastic Hose and Tubing

Thermoplastic hose and tubing achieve their optimum physical properties at room temperature, +68°F (+20°C). As thermoplastic materials are exposed to increased ambient temperatures, they soften and their physical properties change. For hose and tubing, heat sharply reduces the available working pressure and coupling retention. The charts below illustrate this effect. In all cases, test the product in a controlled, secure and safe environment, and consider all operating conditions prior to use.

Example from the Fahrenheit Chart
If Working Pressure at +68°F is 200 PSI, then the WP at +110°F is 200 x 50%, or 100 PSI.

Example from the Celsius Chart
If Working Pressure at +20°C is 14 bar, then the WP at +50°C is 14 x 40%, or 5.6 bar.

CORROSION RESISTANCE OF COUPLING MATERIAL

CAUTION

The following data has been compiled from generally available sources and should not be relied upon without consulting and following the specific recommendations of the manufacturer regarding particular coupling materials.

RATINGS

Metal
1 = Excellent
2 = Good
3 = Fair
X = Not Recommended
- = Contact Factory

Non-Metal
A = Acceptable
X = Not Recommended
- = Contact Factory

Gasket/Seal Material
T = PTFE
V = Viton®
E = EPDM, EPR
N = Neoprene
B = Buna N

NOTE:

(1) Ratings given are based at +70°F. Chemical compatibility varies greatly with temperature. For applications at temperatures other than +70°F, contact the Factory for recommendations.

(2) Gasket / seal materials are not necessarily listed in order of preference.

(3) Chemical resistance of a material does not necessarily indicate the suitability of a fitting in a given application due to variables such as improper clamp and coupling application, special hose construction, gasket material, etc.

Special caution should be taken when handling hazardous materials.
